

Consensus on Social Cognition (ClaCos)

The ClaCoS is a clinical battery for assessing social cognition in adults, designed to objectively assess the social difficulties reported in psychiatry and to guide treatment. It combines a subjective measure and objective tasks exploring the main domains of social cognition: emotion recognition, social perception and knowledge, theory of mind and attributional style. It is particularly useful in adults with psychiatric disorders, especially schizophrenia spectrum disorders and autism spectrum disorder, but can also be used in other clinical or research contexts. Its main value lies in identifying a detailed functional profile that can be used directly for neuropsychological assessment, cognitive remediation, psychoeducation and therapeutic follow-up.

Number of questions	124 questions
Estimated duration	120 minutes
Language	English
Original name	Consensus on Social Cognition
Target audience	Adults
Authors	Collectif Clacos (2022)
Category	Autism spectrum, Psychotic disorders

Administer your questionnaires online

Send your patient a link: they answer from their phone or computer, and you receive the scored results by email.

Scoring & interpretation

Scoring is done by subtest, generally via the HTS platform. The ACSo provides a total score and subscores by process. The TREF provides an overall emotion recognition score, scores by emotion and, depending on the modality, detection thresholds. The PerSo produces interpretation scores with and without help as well as a comprehension score. The MASC provides a total score and types of mentalizing errors. The AIHQ-S provides hostility, attribution and aggression scores.

Interpretation is based on analyzing the profile across tasks, comparing it with the available norms and integrating it with the clinical and neurocognitive data.

Usage

This tool isn't available on Mentaal. To use this questionnaire in your practice, you need a valid license. We invite you to send it directly from the publisher's website.
