

Eysenck Personality Questionnaire-Revised (EPQ-R)

The EPQ-R is a self-administered personality questionnaire based on Eysenck's PEN model. The full adult form explores four distinct dimensions: extraversion, neuroticism, psychoticism, and social desirability. Widely used in clinical, health, occupational, and forensic psychology, as well as in research, it helps describe relatively stable traits rather than a passing emotional state. Its practical value lies in reading the three personality dimensions together with the L scale, which makes it possible to assess the candor of the responses and to nuance the interpretation of the profile.

Number of questions	100 questions
Estimated duration	20 minutes
Language	English
Original name	Eysenck Personality Questionnaire-Revised
Target audience	Adolescents and adults
Authors	Hans J. Eysenck, Sybil B. G. Eysenck (1985)
Category	General

Preview of the 100 questions

Scoring & interpretation

Each answer that matches the scoring key is worth 1 point, and the others 0. Four distinct raw scores are obtained: Psychoticism from 0 to 32, Extraversion from 0 to 23, Neuroticism from 0 to 24, and Lie or social conformity from 0 to 21. Some items are keyed Yes and others No. Raw scores are then compared with the manual's norms, most often as T-scores. A high Extraversion score suggests sociability, activity, and stimulation seeking. A high Neuroticism score suggests greater emotional reactivity. A high Psychoticism score reflects a tougher, colder, more impulsive, or nonconformist style. A high L scale score suggests a favorable self-presentation and calls for caution when interpreting the profile.

Usage

This tool isn't available on Mentaal. To use this questionnaire in your practice, you need a valid license. We invite you to send it directly from the publisher's website.

Are you a psychologist?

With Mentaal, get meaningful insights to support your patients.

- Standardized tests
- Automatic scoring
- Results sent by email
