

Suicidal Ideation Questionnaire - Junior (SIQ-JR)

The SIQ-JR is a self-report questionnaire designed to assess the frequency and intensity of suicidal thoughts in adolescents aged 12 to 18. It allows psychologists to detect the presence and severity of suicidal ideation and supports clinical decisions regarding the safety and follow-up of adolescent patients.

Number of questions	15 questions
Estimated duration	10 minutes
Language	English
Original name	Suicidal Ideation Questionnaire - Junior
Target audience	Adolescents
Authors	William M. Reynolds (1987)
Category	Depression, Adolescent care

Administer your questionnaires online

Send your patient a link: they answer from their phone or computer, and you receive the scored results by email.

Scoring & interpretation

Each item is scored from 0 (I never had this thought) to 6 (almost every day). The scores are summed to obtain a total score; the higher it is, the greater the risk. A clinical cutoff of 31 or more indicates a significant risk of suicidal ideation requiring immediate attention.

Usage

This tool isn't available on Mentaal. To use this questionnaire in your practice, you need a valid license. We invite you to send it directly from the publisher's website.
