

Social Responsiveness Scale (SRS-2)

The SRS-2 assesses the severity of the characteristic social deficits associated with autism spectrum disorder (ASD). It measures five main domains of social behavior: social awareness, social cognition, social communication, social motivation, and restricted and repetitive autistic behaviors. The tool can be completed by parents, teachers, or the individuals themselves, depending on age.

Category	Autism spectrum

Preview of the 65 questions

I feel much more uncomfortable in social situations than when I am alone.

Not true | Sometimes true | Often true | Almost always true

My facial expressions send others the wrong message about what I am really feeling.

Not true | Sometimes true | Often true | Almost always true

I feel confident in myself when I interact with others.

Not true | Sometimes true | Often true | Almost always true

When I am stressed, I behave in rigid or inflexible ways that seem strange to people.

Not true | Sometimes true | Often true | Almost always true

I don't realize when other people are trying to take advantage of me.

Not true | Sometimes true | Often true | Almost always true

Administer your questionnaires online

Send your patient a link: they answer from their phone or computer, and you receive the scored results by email.

Scoring & interpretation

Each item is rated on a 4-point Likert-type scale (from “not true” to “almost always true”). The total score and subscale scores are calculated and then compared with norms to determine the level of difficulties in social interaction and repetitive behaviors. Higher scores indicate more pronounced difficulties.

Usage

This tool isn't available on Mentaal. To use this questionnaire in your practice, you need a valid license. We invite you to send it directly from the publisher's website.
